High Pressure Control

On-Board Ethernet Option

FUNCTIONAL DESCRIPTION of the QB-Series

The QB Series uses Proportion-Air's patented technology for closed loop control. The QB Series valves can be built in either a single loop or double loop control scheme.

The QBT Series is used to control pressure of inert gases from full vacuum up to 175 psig (12 bar).

The QBS is used in applications where the maximum calibrated pressure ranges are between 175 and 500 psig (34 bar). The QBS Series can also be used in applications where the pressure ranges are below 175 psig (12 bar) if the wetted parts on the QBS are compatible with the media being controlled. The QBS Series uses a solid one piece manifold for added strength, available in anodized aluminum or stainless steel. There are two outlet ports which allows flexibility in mounting options. In all QBS models, a stainless steel pressure sensor that utilizes dry technology instead of liquid fill, is used internally for increased reliability and enhanced media compatibility.

THEORY OF OPERATION

The QB1 is a single loop model consisting of valves, manifold, internal pressure transducer, and electronic controls. Output pressure is proportional to an electrical signal input. Pressure is controlled by two solenoid valves. One valve functions as the inlet control, the other as exhaust. The pressure output is measured by a pressure transducer internal to the QB1 and provides a feedback signal to the electronic controls. This feedback signal is compared against the command signal input. A difference between the two signals causes one of the solenoid valves to open allowing flow in or out of the system. Accurate pressure is maintained by controlling these two valves.

The QB2 is similar to the QB1 but uses a double loop control scheme. In addition to the internal pressure transducer, the QB2 also receives a feedback signal from an external sensing device. The external signal functions as the primary feedback signal which is compared against the command signal input. This outer loop comparison is then used to provide a command to the inner loop. A difference between the two comparisons causes one of the solenoid valves to open allowing flow in or out of the system.

Since the external feedback signal is electrical, control is not limited to pressure. Using other types of sensors allows control over parameters such as force, position, flow, etc. Usually in these applications the QB2 valve functions as pilot to a slave regulator controlling the end result. With a sensor providing system feedback, the package becomes a closed loop control system.

The QB control valve is specified as a stand alone valve in static applications with low flow requirements. It can also be used as a pilot to air piloted regulators (volume boosters) in applications where the flow rate of the controlled pressure is higher than QB's flow rate.

COMMAND SIGNAL

Command inputs come in a choice of either 0 to 10 Vdc, 4 to 20mA, Modbus or Ethernet (QBX only).

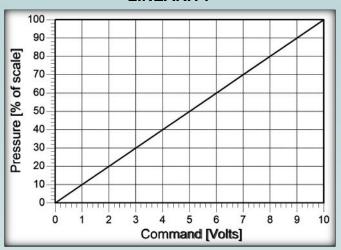

MONITOR SIGNAL

All QB's come with a 0-10 volt or an optional 4-20mA monitor signal for output to a panel meter or controller for data acquisition or quality assurance needs. On a QB1, the monitor signal represents the internal pressure transducer that is measuring the work pressure. On a QB2, the monitor signal represents the signal from the external sensor that is monitoring the output downstream.

PERFORMANCE CHARACTERISTICS

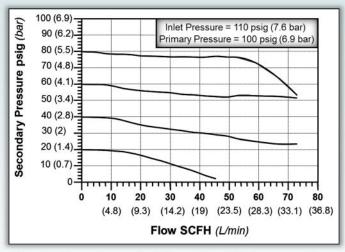

LINEARITY

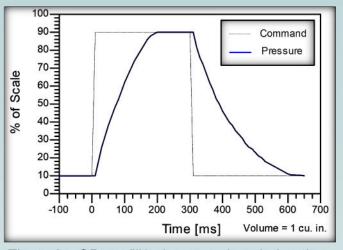

This chart shows the linear characteristics of QB products when given a ramp signal from 0 to 10 volts. Characteristics would be similar for 4 to 20 mA units.

FLOW CHARACTERISTICS

Regulating characteristics of a QB from no flow condition to full flow. To use, choose pressure setting from left end of chart at no flow conditions. Follow curve out until drop begins to occur. Read flow from bottom.

RESPONSE TO STEP INPUT

Times for QB to fill/exhaust a closed chamber. Step command signal is superimposed over pressure trace. Time is determined by the difference between command signal and pressure achieved.

GENERAL INLET PRESSURE RATING

For valve that is ordered with maximum calibrated pressure of:	Maximum inlet pressure is:
Vacuum up to 10 psig (0.7 bar)	Consult factory
11 to 20 psig (0.8 to 1.4 bar)	35 psig (2.4 bar)
21 to 44 psig (1.5 to 3 bar)	55 psig (3.8 bar)
45 to 100 psig (3.1 to 6.9 bar)	110 psig (7.6 bar)
101 to 200 psig (7 to 13.8 bar)	220 psig (15.2 bar)
201 to 300 psig (13.9 to 20.7 bar)	330 psig (22.8 bar)
301 to 500 psig (20.8 to 34 bar)	550 psig (37.9 bar)

As of August 2014 Production of the BB -Series pressure regulator is discontinued. The QBX is the replacement for all BB models. Please contact the factory for assistance in crossing over your old BB units.

Motor Vehicle Manufacturing* (NAICS 3361)

Welding - seam welder force control Atomizing in the painting process Fuel pump flow test with back pressure control Tire & wheel assembly machines

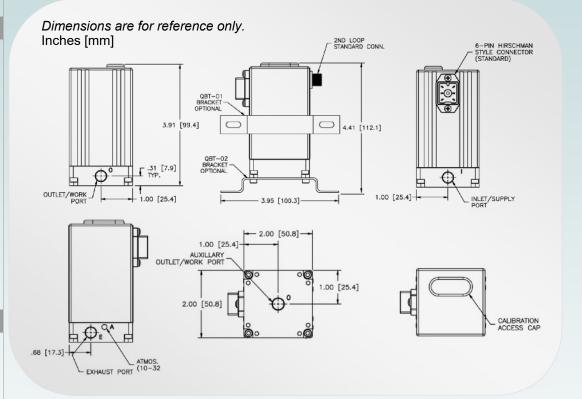

Motor Vehicle Seating & Interior Trim MFG* (NAICS 33636)

Dashboard and interior plastic painting

Die lube spray in seat molds

Calibration of car seat load cells for airbag deployment

*Many applications require more flow than QB-series allows. We will pilot a mechanical regulator without sacrificing accuracy & repeatability for higher flow applications. Call us to discuss your opportunity.

M12 Ethernet Connections (Ethernet option only)

Access hole allows adjustments in the field. Easy tuning of Zero & Span calibration potentiometers

Available in a wide range of electrical control input and analog output

IP65 enclosure allows it to withstand the elements and be washed down without harm (Ethernet QBX is NEMA1)

Multiple inlet/outlet ports for a variety of different mounting configurations

ACCURACY 0.2% F.S. (typical)

PRESSURE RANGE Full Vacuum to 175 psig (12 bar)

PORT SIZE 1/8"

6

Zero Offset

0% Pressure Starts Below Atmosphere

0% Pressure Starts Above Atmosphere

Z 0% Pressure Starts at Zero (Typical)

MAX FLOW 1.2 scfm (34 slpm)

QBX Ethernet Description

The Ethernet QBX product is designed to receive commands and send pressure readings via an Ethernet TCP/IP connection. It contains a pc board which translates the Ethernet packets to analog signals for the analog control pc board.

The commands and data character are sent as ASCII printable characters except for the end of command terminator which is an ASCII carriage return (0d hex). Data cannot contain an alphabetic character, data delimiter or end of command terminator.

Command format:

CCC2n or CCC:ddd.dd2n

C Command String

Command Delimiter =

d = Data

End of Command Terminator ۱n

Examples of commands are as follows:

complete information on the commands may be found in the QB1X/QB2X Ethernet Installation and Maintenance Instructions.

> Set Pressure Command is "spc:120.70" Valid Set Pressure Response is "spr:120.70"

Read Pressure Command is "rpc" Valid Read Pressure Response is "rpr:120.75"

Link & Activity Indication

Full/Half Duplex

Proven Industries and Applications

Applicable to all QB Series Regulators

Aerospace Product & Parts Manufacturing* (NAICS 33641)

Flight simulators - Pressure control on air cylinders to create resistance on yoke and pedals Military flight simulators - seat air bladders, seat belt tensioning and flight suit air bladders

Pilot mask - final product testing using vacuum and positive pressure

Cabin pressure leak testing - low positive pressure and rapid fill

Emergency flotation vest leak testing using positive pressure

Altimeter high pressure component & Pitot tube testing

Aircraft fuselage fatigue testing

Aircraft tire testing

*Many applications require more flow than QB-series allows. We will pilot a mechanical regulator without sacrificing accuracy & repeatability for higher flow applications. Call us to discuss your opportunity.

<u>Dual loop technology</u>: This provides us the capability to control *virtually* any media at any flow rate and any pressure without sacrificing accuracy and repeatability.

It also allows us to take feedback from more than just a pressure transducer. With a properly configured dual loop unit we can take feedback from a vacuum transducer, force transducer, torque, flow or position transducer.

PID loops no longer need tuned in your controller. Proportion-Air's dual loop technology makes proportional control easy. It is already done within the unique Proportion-Air analog circuit. You may need to ramp pressure (or vacuum, or force, or torque, or flow, or position) up and down – the QB2 will track the ramped signal from the PLC or computer and achieve the control setting required.

Accuracy: The downstream pressure transducer senses pressure on the work port of the pressure regulator and allows the QB2 to compensate for inaccuracy brought about by the mechanical properties of the regulator.

Repeatability: High flow capability, hydraulic or pneumatic media capability, more simple-to-use control and extremely repeatable: the same conditions with the same command signal from the same direction can have repeatability as high as 0.02% of full scale calibration.

High flow: Pressure reducing or back pressure regulators are available as large as 6 inch flange mount.

Data Acquisition: Just like other Proportion-Air electronic pressure regulators, the QB2 has an analog output that comes from the controlling transducer. This signal in a dual loop device comes from the downstream transducer.
